

To BLISS-B or not to be - Attacking strongSwan's implementation of Post-Quantum Signatures

Leon Groot Bruinderink

based on joint work with Peter Pessl and **Yuval Yarom**

June 16th, 2017

Lattice-based Cryptography

- Quantum computers pose threat to current cryptography on the internet (DH, RSA, ECC)
- Lattice-based cryptography: promising post-quantum secure alternative.
- Active research on theoretical and practical security.
- Security of implementations (still) largely unexplored.

- Use physical information leakage from implementations
- Leaks through the cache can be exploited without physical access to the victim
- Use that to perform a key-recovery

This part of the talk

- Show side-channel attack on lattice-based signature scheme BLISS
- Model side-channel simply as additional knowledge to attacker
- Show the used key-recovery techniques for BLISS-B
- Yuval will give details on side-channel attack on strongSwan's implementation of BLISS-B

BLISS

BLISS Lattice-based Signature Scheme

- Bimodal Lattice Signature Scheme (BLISS) (CRYPTO '13 by Ducas, Durmus, Lepoint and Lyubashevsky)
- Later improved by Ducas (BLISS-B)
- Implementations available via NTRU lattices (polynomials in $R_q = \mathbb{Z}_q[x]/(x^n + 1)$, $n = 2^r$, prime q).
- For $f, g \in R_q = \mathbb{Z}_q[x]/(x^n + 1)$:

$$f \cdot g = \mathbf{f}G = \mathbf{g}F$$

where $F, G \in \mathbb{Z}_q^{n \times n}$, whose columns are rotations of \mathbf{f}, \mathbf{g} , with possibly opposite sign:

$$F = \begin{bmatrix} f_0 & -f_{n-1} & \dots & -f_1 \\ f_1 & f_0 & \dots & -f_2 \\ \dots & \dots & \dots & \dots \\ f_{n-1} & f_{n-2} & \dots & f_0 \end{bmatrix}$$

BLISS Lattice-based Signature Scheme

- Secret key $\mathbf{S} = (f, 2g + 1) \in R_q^2$ with f, g sparse and typically entries in $\{\pm 1, 0\}$
- Public key $\mathbf{A} = (a_1, a_2) \in R_q^2$ satisfying:

$$a_1 s_1 + a_2 s_2 \equiv q \pmod{2q}$$

- Computed as $a_q = (2g + 1)/f \pmod{q}$ (restart if f not invertible) and $\mathbf{A} = (2a_q, q - 2)$.
- Attacker can validate correctness for candidate of key f with the public key and compute $2g + 1$.
- Both $-\mathbf{S}$ and \mathbf{S} are valid as secret key.

BLISS Lattice-based Signature Scheme

- Simplified version of the BLISS signature algorithm for message μ :

BLISS Lattice-based Signature Scheme

- Simplified version of the BLISS signature algorithm for message μ :
- 1 Sample $\mathbf{y} \leftarrow D_{\mathbb{Z}^n, \sigma}$.

BLISS Lattice-based Signature Scheme

- Simplified version of the BLISS signature algorithm for message μ :
 - 1 Sample $\mathbf{y} \leftarrow D_{\mathbb{Z}^n, \sigma}$.
 - 2 Construct vector \mathbf{u} , using \mathbf{y} and public key \mathbf{A} .

BLISS Lattice-based Signature Scheme

- Simplified version of the BLISS signature algorithm for message μ :
 - 1 Sample $\mathbf{y} \leftarrow D_{\mathbb{Z}^n, \sigma}$.
 - 2 Construct vector \mathbf{u} , using \mathbf{y} and public key \mathbf{A} .
 - 3 Construct challenge $\mathbf{c} = H(\mathbf{u}, \mu) \in \{0, 1\}^n$ with $\|\mathbf{c}\|_1 = \kappa$

BLISS Lattice-based Signature Scheme

- Simplified version of the BLISS signature algorithm for message μ :
 - 1 Sample $\mathbf{y} \leftarrow D_{\mathbb{Z}^n, \sigma}$.
 - 2 Construct vector \mathbf{u} , using \mathbf{y} and public key \mathbf{A} .
 - 3 Construct challenge $\mathbf{c} = H(\mathbf{u}, \mu) \in \{0, 1\}^n$ with $\|\mathbf{c}\|_1 = \kappa$
 - 4 Generate a random bit b . Set $\mathbf{z} = \mathbf{y} + (-1)^b \mathbf{s}_1 \cdot \mathbf{c}$

BLISS Lattice-based Signature Scheme

- Simplified version of the BLISS signature algorithm for message μ :
 - 1 Sample $\mathbf{y} \leftarrow D_{\mathbb{Z}^n, \sigma}$.
 - 2 Construct vector \mathbf{u} , using \mathbf{y} and public key \mathbf{A} .
 - 3 Construct challenge $\mathbf{c} = H(\mathbf{u}, \mu) \in \{0, 1\}^n$ with $\|\mathbf{c}\|_1 = \kappa$
 - 4 Generate a random bit b . Set $\mathbf{z} = \mathbf{y} + (-1)^b \mathbf{s}_1 \cdot \mathbf{c}$
 - 5 Return signature (\mathbf{z}, \mathbf{c}) for μ .

BLISS Lattice-based Signature Scheme

- Simplified version of the BLISS signature algorithm for message μ :
 - 1 Sample $\mathbf{y} \leftarrow D_{\mathbb{Z}^n, \sigma}$.
 - 2 Construct vector \mathbf{u} , using \mathbf{y} and public key \mathbf{A} .
 - 3 Construct challenge $\mathbf{c} = H(\mathbf{u}, \mu) \in \{0, 1\}^n$ with $\|\mathbf{c}\|_1 = \kappa$
 - 4 Generate a random bit b . Set $\mathbf{z} = \mathbf{y} + (-1)^b \mathbf{s}_1 \cdot \mathbf{c}$
 - 5 Return signature (\mathbf{z}, \mathbf{c}) for μ .
- $\mathbf{s}_1 \cdot \mathbf{c} = \mathbf{s}_1 C$ over \mathbb{Z} for matrix $C \in \{-1, 0, 1\}^{n \times n}$.

BLISS Lattice-based Signature Scheme

- Simplified version of the BLISS signature algorithm for message μ :
 - 1 Sample $\mathbf{y} \leftarrow D_{\mathbb{Z}^n, \sigma}$.
 - 2 Construct vector \mathbf{u} , using \mathbf{y} and public key \mathbf{A} .
 - 3 Construct challenge $\mathbf{c} = H(\mathbf{u}, \mu) \in \{0, 1\}^n$ with $\|\mathbf{c}\|_1 = \kappa$
 - 4 Generate a random bit b . Set $\mathbf{z} = \mathbf{y} + (-1)^b \mathbf{s}_1 \cdot \mathbf{c}$
 - 5 Return signature (\mathbf{z}, \mathbf{c}) for μ .
- $\mathbf{s}_1 \cdot \mathbf{c} = \mathbf{s}_1 C$ over \mathbb{Z} for matrix $C \in \{-1, 0, 1\}^{n \times n}$.
- Equation in signature over \mathbb{Z} :

$$\mathbf{z} = \mathbf{y} + (-1)^b \mathbf{s}_1 C$$

where the unknowns for the attacker are $\mathbf{y}, b, \mathbf{s}_1$

Discrete Gaussian Distribution

Figure 1: Discrete Gaussian distribution

- Step 1 in signature algorithm: $\mathbf{y} \leftarrow D_{\mathbb{Z}^m, \sigma}$
- This is required to achieve (provable) security and small signature size.
- Not straightforward to do in practice: high precision required.
- But how do we use additional knowledge of \mathbf{y} to find \mathbf{s} ?

Attack Scenario's

Attack Scenario 1

- Signature equation: $\mathbf{z} = \mathbf{y} + (-1)^b \mathbf{s}C$

Scenario 1:

We can determine \mathbf{y} completely from a side-channel attack

Attack Scenario 1

- Signature equation: $\mathbf{z} = \mathbf{y} + (-1)^b \mathbf{s}C$

Scenario 1:

We can determine \mathbf{y} completely from a side-channel attack

- Only need one signature.
- Solve equation $(-1)^b(\mathbf{z} - \mathbf{y}) = \mathbf{s}C$ for \mathbf{s} .
- But unlikely...(?)

Attack Scenario 2

- System of n equations over \mathbb{Z} :

$$\underbrace{\begin{bmatrix} z_0 \\ z_1 \\ \dots \\ z_{n-1} \end{bmatrix}}_{\text{Signature}} = \underbrace{\begin{bmatrix} y_0 \\ y_1 \\ \dots \\ y_{n-1} \end{bmatrix}}_{\text{Noise}} + \underbrace{(-1)^b}_{\text{Sign}} \underbrace{\begin{bmatrix} - & \mathbf{c}_0 & - \\ - & \mathbf{c}_1 & - \\ - & \dots & - \\ - & \mathbf{c}_{n-1} & - \end{bmatrix}}_{\text{Challenge}} \cdot \underbrace{\begin{bmatrix} s_0 \\ s_1 \\ \dots \\ s_{n-1} \end{bmatrix}}_{\text{Secret}}$$

Scenario 2:

For some coefficients an attacker can determine y_i .

Attack Scenario 2

- System of n equations over \mathbb{Z} :

$$\underbrace{\begin{bmatrix} z_0 \\ z_1 \\ \dots \\ z_{n-1} \end{bmatrix}}_{\text{Signature}} = \underbrace{\begin{bmatrix} y_0 \\ y_1 \\ \dots \\ y_{n-1} \end{bmatrix}}_{\text{Noise}} + \underbrace{(-1)^b}_{\text{Sign}} \underbrace{\begin{bmatrix} - & \mathbf{c}_0 & - \\ - & \mathbf{c}_1 & - \\ - & \dots & - \\ - & \mathbf{c}_{n-1} & - \end{bmatrix}}_{\text{Challenge}} \cdot \underbrace{\begin{bmatrix} s_0 \\ s_1 \\ \dots \\ s_{n-1} \end{bmatrix}}_{\text{Secret}}$$

Scenario 2:

For some coefficients an attacker can determine y_i .

- Zoom in on coordinate-wise equalities:

$$z_i = y_i + (-1)^b \langle \mathbf{c}_i, \mathbf{s} \rangle$$

- If we know y_i , we save $\zeta_k = \mathbf{c}_i$ in a list with y_i and z_i .

Attack Scenario 2

- We can acquire enough of these vectors from multiple signatures and form:

$$\begin{bmatrix} (-1)^{b_0}(z_0 - y_0) \\ (-1)^{b_1}(z_1 - y_1) \\ \dots \\ (-1)^{b_{n-1}}(z_{n-1} - y_{n-1}) \end{bmatrix} = \begin{bmatrix} - & \zeta_0 & - \\ - & \zeta_1 & - \\ - & \dots & - \\ - & \zeta_{n-1} & - \end{bmatrix} \cdot \begin{bmatrix} s_0 \\ s_1 \\ \dots \\ s_{n-1} \end{bmatrix}$$

- Unfortunately: all bits b_i are unknown.

Attack Scenario 2

- We can acquire enough of these vectors from multiple signatures and form:

$$\begin{bmatrix} (-1)^{b_0}(z_0 - y_0) \\ (-1)^{b_1}(z_1 - y_1) \\ \dots \\ (-1)^{b_{n-1}}(z_{n-1} - y_{n-1}) \end{bmatrix} = \begin{bmatrix} - & \zeta_0 & - \\ - & \zeta_1 & - \\ - & \dots & - \\ - & \zeta_{n-1} & - \end{bmatrix} \cdot \begin{bmatrix} s_0 \\ s_1 \\ \dots \\ s_{n-1} \end{bmatrix}$$

- Unfortunately: all bits b_i are unknown.
- Trick: if we know y_i , we can *be selective* and ensure that $z_i = y_i$, before saving $\zeta_k = \mathbf{c}_i$ in our list.
- We can eliminate b :

$$(-1)^b(z_i - y_i) = 0 = \langle \zeta_k, \mathbf{s} \rangle$$

Attack Scenario 2

- If we know y_i and $z_i = y_i$: we save $\zeta_k = \mathbf{c}_i$.
- Acquire enough of these vectors from multiple signatures and we have equation:

$$\mathbf{sL} = \mathbf{0}$$

- With very high probability: secret vector \mathbf{s} is the only vector in the integer (left) kernel of \mathbf{L} .

Attack Scenario 3

- Signature equation over \mathbb{Z} : $\mathbf{z} = \mathbf{y} + (-1)^b \mathbf{C}\mathbf{s}$.
- Let us go one step further:

Scenario 3:

For some coefficients an attacker knows $y_i \in \{\gamma, \gamma + 1\}$
and with high probability, $y_i = \gamma$

Attack Scenario 3

- Apply same method as previous:
- If we know $y_i \in \{\gamma, \gamma + 1\}$ and $z_i = \gamma$: we save $\zeta_k = \mathbf{c}_i$.
- Now \mathbf{sL} is not an all-zero vector, but it is small.
- Use LLL-algorithm to compute small vectors, search for \mathbf{s} in the unitary transformation matrix.
- Verify correctness with public key.

Results of Attacking BLISS

Figure 2: Success probability of LLL

- Previous attack scenario 2 and 3 were achievable in real-life

Improving Side-channel Attacks on BLISS

BLISS-B: accelerating signatures

- A new variant BLISS-B proposed, accelerating signing time by 2.8.
- Recall signature (\mathbf{z}, \mathbf{c}) with:

$$\mathbf{z} = \mathbf{y} + (-1)^b \mathbf{s}_1 \cdot \mathbf{c}$$

where the unknowns for the attacker are $\mathbf{y}, b, \mathbf{s}_1$

BLISS-B: accelerating signatures

- A new variant BLISS-B proposed, accelerating signing time by 2.8.
- Recall signature (\mathbf{z}, \mathbf{c}) with:

$$\mathbf{z} = \mathbf{y} + (-1)^b \mathbf{s}_1 \cdot \mathbf{c}$$

where the unknowns for the attacker are $\mathbf{y}, b, \mathbf{s}_1$

- In BLISS-B, this is transformed to signature (\mathbf{z}, \mathbf{c}) with:

$$\mathbf{z} = \mathbf{y} + (-1)^b \mathbf{s}_1 \cdot \mathbf{c}^*$$

where $\mathbf{c} \equiv \mathbf{c}^* \pmod{2}$.

- Unknowns to attacker now are $\mathbf{y}, b, \mathbf{s}_1$ **and** the signs of \mathbf{c}^* .

BLISS-B: accelerating signatures

- A new variant BLISS-B proposed, accelerating signing time by 2.8.
- Recall signature (\mathbf{z}, \mathbf{c}) with:

$$\mathbf{z} = \mathbf{y} + (-1)^b \mathbf{s}_1 \cdot \mathbf{c}$$

where the unknowns for the attacker are $\mathbf{y}, b, \mathbf{s}_1$

- In BLISS-B, this is transformed to signature (\mathbf{z}, \mathbf{c}) with:

$$\mathbf{z} = \mathbf{y} + (-1)^b \mathbf{s}_1 \cdot \mathbf{c}^*$$

where $\mathbf{c} \equiv \mathbf{c}^* \pmod{2}$.

- Unknowns to attacker now are $\mathbf{y}, b, \mathbf{s}_1$ **and** the signs of \mathbf{c}^* .
- The attacker cannot build the matrix/lattice basis in previous attacks!

A new key-recovery attack on BLISS-B: step 1

- Assume (possibly erroneous) information on y_i
- Coordinate-wise equalities in signature:

$$z_i = y_i + (-1)^b \langle \mathbf{c}_i^*, \mathbf{s} \rangle$$

where attacker knows $\mathbf{c}_i \equiv \mathbf{c}_i^* \pmod{2}$ and z_i

A new key-recovery attack on BLISS-B: step 1

- Assume (possibly erroneous) information on y_i
- Coordinate-wise equalities in signature:

$$z_i = y_i + (-1)^b \langle \mathbf{c}_i^*, \mathbf{s} \rangle$$

where attacker knows $\mathbf{c}_i \equiv \mathbf{c}_i^* \pmod{2}$ and z_i

- Step 1: perform previous attack over $GF(2)$!
- No need of requiring $z_i = y_i$ (with high probability)
- Instead of LLL, use a LPN-solver
- This part gives the secret $\tilde{\mathbf{s}} \equiv \mathbf{s} \pmod{2}$

A new key-recovery attack on BLISS-B: step 2

- Assume (possibly erroneous) information on y_i
- Coordinate-wise equalities in signature:

$$z_i = y_i + (-1)^b \langle \mathbf{c}_i^*, \mathbf{s} \rangle$$

where attacker knows $\mathbf{c}_i \equiv \mathbf{c}_i^* \pmod{2}$ and z_i

- Attacker also knows $\tilde{\mathbf{s}} \equiv \mathbf{s} \pmod{2}$ from step 1
- But keys can have $\mathbf{s}_i = \pm 2$, which are not detected by step 1.

A new key-recovery attack on BLISS-B: step 2

- Assume (possibly erroneous) information on y_i
- Coordinate-wise equalities in signature:

$$z_i = y_i + (-1)^b \langle \mathbf{c}_i^*, \mathbf{s} \rangle$$

where attacker knows $\mathbf{c}_i \equiv \mathbf{c}_i^* \pmod{2}$ and z_i

- Attacker also knows $\tilde{\mathbf{s}} \equiv \mathbf{s} \pmod{2}$ from step 1
- But keys can have $\mathbf{s}_i = \pm 2$, which are not detected by step 1.
- Suppose

$$|z_i - y_i| = |\langle \mathbf{c}_i^*, \mathbf{s} \rangle| > |\langle \mathbf{c}_i, \tilde{\mathbf{s}} \rangle|$$

A new key-recovery attack on BLISS-B: step 2

- Assume (possibly erroneous) information on y_i
- Coordinate-wise equalities in signature:

$$z_i = y_i + (-1)^b \langle \mathbf{c}_i^*, \mathbf{s} \rangle$$

where attacker knows $\mathbf{c}_i \equiv \mathbf{c}_i^* \pmod{2}$ and z_i

- Attacker also knows $\tilde{\mathbf{s}} \equiv \mathbf{s} \pmod{2}$ from step 1
- But keys can have $\mathbf{s}_i = \pm 2$, which are not detected by step 1.
- Suppose

$$|z_i - y_i| = |\langle \mathbf{c}_i^*, \mathbf{s} \rangle| > |\langle \mathbf{c}_i, \tilde{\mathbf{s}} \rangle|$$

- There has to be *at least* one factor ± 2 making up for difference!
- Save \mathbf{c}_i in a list

A new key-recovery attack on BLISS-B: step 2

- Suppose

$$|z_i - y_i| = |\langle \mathbf{c}_i^*, \mathbf{s} \rangle| > |\langle \mathbf{c}_i, \tilde{\mathbf{s}} \rangle|$$

- Save \mathbf{c}_i in a list
- Acquire many of these events...
- Two ways of extracting all coordinates of \mathbf{s} that are ± 2 :
 - Integer Programming solver
 - Statistical approach
- This part of the attack gives all magnitudes of the secret: $|\mathbf{s}|$

A new key-recovery attack on BLISS-B: final step

- So far, the attacker knows all magnitudes of the secret: $|\mathbf{s}| = |\mathbf{s}_1|$
- For the final step, we use the public key $\mathbf{A} = (2a_q, q - 2)$ and $|\mathbf{s}_1|$.

A new key-recovery attack on BLISS-B: final step

- So far, the attacker knows all magnitudes of the secret: $|\mathbf{s}| = |\mathbf{s}_1|$
- For the final step, we use the public key $\mathbf{A} = (2a_q, q - 2)$ and $|\mathbf{s}_1|$.
- Recall the key-relation over $R_q = \mathbb{Z}_q[x]/(x^n + 1)$

$$a_q = s_2/s_1 = (2g + 1)/f \pmod{q}$$

- Can model this relation as $\mathbf{A}_1 \mathbf{s}_1 = \mathbf{s}_2$ for matrix \mathbf{A}_1 (q-ary lattice)

A new key-recovery attack on BLISS-B: final step

- So far, the attacker knows all magnitudes of the secret: $|\mathbf{s}| = |\mathbf{s}_1|$
- For the final step, we use the public key $\mathbf{A} = (2a_q, q - 2)$ and $|\mathbf{s}_1|$.
- Recall the key-relation over $R_q = \mathbb{Z}_q[x]/(x^n + 1)$

$$a_q = s_2/s_1 = (2g + 1)/f \pmod{q}$$

- Can model this relation as $\mathbf{A}_1 \mathbf{s}_1 = \mathbf{s}_2$ for matrix \mathbf{A}_1 (q -ary lattice)
- Final step a: remove all columns j of \mathbf{A}_1 where $|\mathbf{s}_1|_j = 0$

A new key-recovery attack on BLISS-B: final step

- So far, the attacker knows all magnitudes of the secret: $|\mathbf{s}| = |\mathbf{s}_1|$
- For the final step, we use the public key $\mathbf{A} = (2a_q, q - 2)$ and $|\mathbf{s}_1|$.
- Recall the key-relation over $R_q = \mathbb{Z}_q[x]/(x^n + 1)$

$$a_q = s_2/s_1 = (2g + 1)/f \pmod{q}$$

- Can model this relation as $\mathbf{A}_1 \mathbf{s}_1 = \mathbf{s}_2$ for matrix \mathbf{A}_1 (q -ary lattice)
- Final step a: remove all columns j of \mathbf{A}_1 where $|\mathbf{s}_1|_j = 0$
- Final step b: remove some rows of \mathbf{A}_1 and try to solve $\mathbf{A}_1^* \mathbf{s}_1^* = \mathbf{s}_2^*$ using BKZ. This gives \mathbf{s}_1^* which completely recovers \mathbf{s}_1

A new key-recovery attack on BLISS-B: final step

- So far, the attacker knows all magnitudes of the secret: $|\mathbf{s}| = |\mathbf{s}_1|$
- For the final step, we use the public key $\mathbf{A} = (2a_q, q - 2)$ and $|\mathbf{s}_1|$.
- Recall the key-relation over $R_q = \mathbb{Z}_q[x]/(x^n + 1)$

$$a_q = s_2/s_1 = (2g + 1)/f \pmod{q}$$

- Can model this relation as $\mathbf{A}_1 \mathbf{s}_1 = \mathbf{s}_2$ for matrix \mathbf{A}_1 (q -ary lattice)
- Final step a: remove all columns j of \mathbf{A}_1 where $|\mathbf{s}_1|_j = 0$
- Final step b: remove some rows of \mathbf{A}_1 and try to solve $\mathbf{A}_1^* \mathbf{s}_1^* = \mathbf{s}_2^*$ using BKZ. This gives \mathbf{s}_1^* which completely recovers \mathbf{s}_1
- Final step c: compute \mathbf{s}_2 by $a_q \cdot \mathbf{s}_1$

Results of the full attack on BLISS-B

- BLISS-B implemented in strongSwan (library for secure VPN), Yuval will cover how
- Performed full real-life attack using previous steps on strongSwan

(a) Linear Programming

(b) Statistical

Figure 3: Success rate for recovery of ± 2 coefficients

Sampling from a discrete Gaussian distribution

Rejection sampling / Bernoulli Sampler

- A way of sampling discrete Gaussians is by Rejection sampling
- Multiple samplers in literature.

Rejection sampling / Bernoulli Sampler

- 1 Approximate $p(x)$ with another PDF $g(x)$, which is easy to compute.

Rejection sampling / Bernoulli Sampler

- 2 Generate x in domain, according to $g(x)$

Rejection sampling / Bernoulli Sampler

- 3 Generate random $c \in [0, g(x))$. Accept x if $c \leq p(x)$.

- Rejection samplers for discrete Gaussians need to sample from $Ber(\exp(-x/f))$ for varying $x \in \mathbb{R}$ and constant $f > 0$ (usually $f = 2\sigma^2$).
- High precision required, so not straightforward to do.

Attacking Bernoulli sampler

- New method introduced in BLISS paper to sample from $Ber(\exp(-x/f))$ for $x \in \mathbb{R}$

Attacking Bernoulli sampler

- New method introduced in BLISS paper to sample from $Ber(\exp(-x/f))$ for $x \in \mathbb{R}$
- Precompute table $ET[i] = \exp(-2^i/f)$ for $0 \leq i \leq \ell - 1$.

Attacking Bernoulli sampler

- New method introduced in BLISS paper to sample from $Ber(\exp(-x/f))$ for $x \in \mathbb{R}$
- Precompute table $ET[i] = \exp(-2^i/f)$ for $0 \leq i \leq \ell - 1$.
- Assume input $x \in [0, 2^\ell)$, write as $x = x_{\ell-1} \dots x_0$

Attacking Bernoulli sampler

- New method introduced in BLISS paper to sample from $Ber(\exp(-x/f))$ for $x \in \mathbb{R}$
- Precompute table $ET[i] = \exp(-2^i/f)$ for $0 \leq i \leq \ell - 1$.
- Assume input $x \in [0, 2^\ell)$, write as $x = x_{\ell-1} \dots x_0$
- At sampling time:

Attacking Bernoulli sampler

- New method introduced in BLISS paper to sample from $Ber(\exp(-x/f))$ for $x \in \mathbb{R}$
- Precompute table $ET[i] = \exp(-2^i/f)$ for $0 \leq i \leq \ell - 1$.
- Assume input $x \in [0, 2^\ell)$, write as $x = x_{\ell-1} \dots x_0$
- At sampling time:
 - 1 For index $j \in [0, \dots, \ell - 1]$
 - 2 If bit $x_j = 1$, sample $b \leftarrow Ber(ET[j])$. If $b = 0$, reject sample.

Attacking Bernoulli sampler

- New method introduced in BLISS paper to sample from $Ber(\exp(-x/f))$ for $x \in \mathbb{R}$
- Precompute table $ET[i] = \exp(-2^i/f)$ for $0 \leq i \leq \ell - 1$.
- Assume input $x \in [0, 2^\ell)$, write as $x = x_{\ell-1} \dots x_0$
- At sampling time:
 - 1 For index $j \in [0, \dots, \ell - 1]$
 - 2 If bit $x_j = 1$, sample $b \leftarrow Ber(ET[j])$. If $b = 0$, reject sample.
 - 3 Accept sample if all ℓ indices passed rejection steps.

Attacking Bernoulli sampler

- New method introduced in BLISS paper to sample from $Ber(\exp(-x/f))$ for $x \in \mathbb{R}$
- Precompute table $ET[i] = \exp(-2^i/f)$ for $0 \leq i \leq \ell - 1$.
- Assume input $x \in [0, 2^\ell)$, write as $x = x_{\ell-1} \dots x_0$
- At sampling time:
 - 1 For index $j \in [0, \dots, \ell - 1]$
 - 2 If bit $x_j = 1$, sample $b \leftarrow Ber(ET[j])$. If $b = 0$, reject sample.
 - 3 Accept sample if all ℓ indices passed rejection steps.
- **If ET is not accessed during sampling, input to Bernoulli sampler $x = 0$**

Attacking BLISS with Bernoulli-based sampler

- New rejection sampler described in BLISS paper for sampling discrete Gaussians using Bernoulli sampler as subroutine.
- **If ET is not accessed during sampling, input to Bernoulli sampler $x = 0$**

Attacking BLISS with Bernoulli-based sampler

- New rejection sampler described in BLISS paper for sampling discrete Gaussians using Bernoulli sampler as subroutine.
- **If ET is not accessed during sampling, input to Bernoulli sampler $x = 0$**
- From this, one can apply attack method of scenario 2:

Scenario 2:

For some coefficients an attacker can determine y_i .

- This is also implemented by strongSwans implementation of BLISS-B
- Yuval will show in the next part how to attack the sampler in practice

Questions on this part of the talk?
